

Compilations Studio

Usage guide — turn @Arab's catalog into compilation videos

A @Arab

The 60-second pitch

You give it a theme. Claude scans every transcript, returns the best moments with timestamps anchored to the start of a sentence, and lets you assemble a clip list to export for your editor. Built for shipping themed compilations off @Arab's longform catalog.

106 longform videos indexed	4,305 transcript chunks
53 hours of footage	96M+ total views

The four tabs

01 Library Browse every video. Use AI search to rank by relevance to a topic (e.g. <i>"eating crazy food"</i> → rat poison, hallucination honey, jungle cuisine). Each card has a 0–100 score badge. Click any video for the player + full transcript.	02 Workspace The build view. Type a theme → Find moments → Claude returns clip cards grouped by video. Click a thumbnail to preview in the persistent right-side player. Click + Add to assemble.
03 Titles Brainstorm viral compilation titles. Claude proposes 8 options with alt titles + source video suggestions. Save the ones you like, or Build to drop into the Workspace.	04 Saved All your in-progress compilations. Click any clip thumbnail to preview inline. Resume to keep working, Export CSV for your editor, Delete when done.

End-to-end workflow

1. Titles Brainstorm pitch	→	2. Save Bookmark good ones	→	3. Build Triggers workspace	→	4. Find moments Pull clips	→	5. + Add Assemble	→	6. Export CSV Hand to editor
-------------------------------	---	-------------------------------	---	--------------------------------	---	-------------------------------	---	----------------------	---	---------------------------------

Tip — Title style. The AI is trained to avoid *"I Spent X Days With Y"* (Arab's own vlog hooks) and listicle phrasings. It produces multi-story-implying titles like *"Times Brazil Got Out of Control"* or *"Why You Don't Mess With Favelas"* — viral without screaming compilation.

Two ways to start a compilation

From a Title - Go to Titles - Type a seed theme or leave blank - Click Generate ideas - Pick one → Build - You're dropped into the Workspace with the title pre-loaded and moments already searching	Directly in Workspace - Go to Workspace - Type a theme like <i>"moments locals turned on him"</i> - Click Find moments - Add clips you like — first + Add creates a new untitled compilation automatically - Rename it inline anytime

Tips, shortcuts & power moves

Page 2 — the stuff that'll save you time

A

How clip extraction actually works

Each video's transcript is split into ~45-second chunks, but each chunk keeps the underlying line-level YouTube auto-caption timing. When you search, the AI:

- **Stage 1** — ranks all 106 video titles + descriptions for relevance to your theme
- **Stage 2** — scans the top 8 picked videos' transcripts in parallel
- Returns 1–5 minute moments with **start times that match a line boundary** — clips never start mid-word

The persistent inline player

One `iframe` for the whole app. Clicking different clip thumbnails seeks via `postMessage` instead of reloading. You can switch between 8 clips in 8 seconds without YouTube re-loading once.

State persists across tabs

Your theme, generated ideas, search results, and active compilation are saved to `localStorage`. Navigate to Library, come back, everything's still there. Same after refresh.

AI Library search

Plain text search only matches title/description substrings. **AI search** (Sparkles icon) sends your query + the whole 106-video index to Claude with a relevance scoring rubric.

- 90–100 = dominant subject
- 70–89 = strong match
- 40–69 = touched on
- <25 filtered out

Adding new @Arab uploads

On the Library page, hit + **Add video**. Paste any YouTube URL or 11-char ID. The server:

1. Fetches metadata via YouTube API
 2. Validates channel = @Arab
 3. Shells out to `yt-dlp` for auto-captions
 4. Parses VTT, dedupes rolling-caption duplicates, chunks at ~45s
 5. Appends to `catalog.json` + `chunks.json`
- Available in the next AI search instantly.

CSV export format

Each row in the export is one clip: `#`, video title, full URL, URL with `?t=Xs` jump, in-timecode (HH:MM:SS), out-timecode, duration_sec, note (the quoted line).

Saved Titles vs Saved Compilations

- **Titles** = an idea + suggested videos, no clips assembled yet. Bookmarks for later.
- **Saved** = an actual compilation with picked clips, timestamps, ready to export.

Keyboard shortcuts

- `Enter` in the workspace theme input — Find moments
- `Enter` in the titles theme input — Generate ideas
- `Esc` in any modal — Cancel
- `Enter` in delete modal — Confirm

Tabs of @Arab's catalog

106 videos, filtered to 10+ minutes, post Sept 2022 (Turkey Replica cutoff). Excluded: streaming/gaming/Tinder rating content per blacklist. Re-run scraper to refresh.

Visual cheat sheet

Workspace

02

Type theme → **Find moments**

- > Click thumbnail → plays in right panel
- > **+ Add** → into compilation

Titles

03

Seed theme → **Generate ideas**

- > Each idea → **Save** or **Build**
- > Saved sit below for later

Saved

04

Click any thumb → inline preview

- > **Resume** = back to workspace
- > **Export CSV** → editor file

Tip — **Don't overload one compilation**. Target 15–60 minutes. 8 clips at 90 seconds each = a tight 12-minute video. Quality > quantity. Click each clip's thumbnail to preview before adding so you know it actually delivers.
